What is Cloud Seeding?

Have you ever heard of cloud seeding?

It is 50-year-old technology designed to stimulate rainfall, and an important component is silver.

How does it work?

Particles made of silver iodide are dropped into clouds from planes or pushed up into clouds from machines on the ground. The silver iodide attracts moisture, which adheres to the particles. When the particles become too heavy, they fall – either as raindrops or snow, depending upon the temperature.

Where has this technology been used?

In the US, it has been used in Texas.
